

## Project as a resilient temporary system: Reflection on the art of projectification in professional contexts

Behnod Barmayehvar<sup>1</sup>

### Abstract

Due to the increasing importance of project knowledge and its application in various organizations and firms, it is necessary to investigate the use of project features and capacities in different contexts of working and non-working life. Therefore, the main goal of this research is to explain the concept and function of the project as a resilient temporary system for projectification in professional contexts in order to improve functions, improve the quality of outputs and increase the probability of achieving the expected results. In this exploration, research information was collected through library study of theoretical foundations. Then, by using the qualitative content analysis method, the research findings were obtained. The results of this research show that having project mindset as well as exploiting the nature and coordinates of the project as a resilient temporary system, especially by reorganizing the system and buffering (time, cost, quality, resources, etc.) to recover to past conditions, when facing accidents and events unpredictability can play a significant role in the effective progress of affairs. Finally, it is suggested that in order to achieve success, in terms of limitations and considerations, with a focus on purposefulness, planning and controlling, the art of projectification in different contexts in a professional manner and by taking advantage of the talent and assets of each person or group regarding knowledge and vision and attitude of the project-orientedness, should be taken into account to manage things as best as possible.
